

Acknowledgments

Everything engineers create is an integration of many ideas. This book is no exception. Our aim was to produce something novel and useful by building on insights from many sources. We owe a debt of gratitude to the many people who have lent their time and energy to making this a better book. In particular, we would like to thank Jonathan Schwartz for his support of this project and Sun Microsystems for providing many of the examples used throughout the text.

Special thanks go to Al Riske for his hard work in the early days of this project. We would also like to express our deep appreciation to the following individuals who agreed to be interviewed, provide feedback about drafts, lend their expertise, or help us remedy errors along the way: Michael Anastasio, Kaj Arnöo, Subodh Bapat, Craig Carlson, Sheueling Chang, Michelle Denedy, Greg Doench, Lori Duvall, Damien Eastwood, Steven Eppinger, Michael Falk, John L. Hennessey, Christy Confetti Higgins, Daniel Hillis, Mary Holzer, Joel Makower, Sohrab Modi, Dean Nelson, David Patterson, Mike Shapiro, Robert Sproull, Hal Stern, Harold Steudel, Dr. Ivan Sutherland, Michael Thurston, Chuck Vest, Andrew Winston, and Dr. Bill Wulf.

Thank you also to Carrie Motamedi, for her persistence and drive in keeping this project on track; and to Ingrid Van den Hoogen and Anil Gadre for their encouragement and enthusiasm.

Finally, we want to offer our thanks to our families for the inspiration and wondrous gifts they give us every day, and also offer up the following personal acknowledgments.

David Douglas: I would like to recognize the people who helped make engineering such an important part of my life. Steve Ward, Danny Hillis, and

Dave Patterson added to my technical education, but more importantly they taught me the fun and rewards of fully embracing a life of innovation. I'd also like to thank the eco team at Sun for being a constant source of inspiration. And finally, I'd like to thank my dad, Robert Douglas, who led the way and encouraged my technical learning from early on.

Greg Papadopoulos: I'm hoping that history will end up recognizing the essential work of Richard Stallman, the GNU Project, and the Free Software Foundation in pioneering the ideal of developer freedom. Richard, along with Lawrence Lessig, has had a fundamental influence on my views on the interplay between creativity and control. On the connection of engineering with society, much was catalyzed by my work with the Anita Borg Institute for Women and Technology, and conversations there with the late Richard Newton were particularly encouraging. But here, the real seeds were planted years ago by my father, Michael Papadopoulos, and my mentor, Michael Dertouzos: two Greek-Americans who reveled in that beautiful intersection between science and the human spirit. They both live in my memory every day.
